RESUMEN

El presente trabajo registra alrededor de 3300 especies de Cerambycidae conocidas para Norteamérica, Centroamérica y las Indias Occidentales. Se incluyen los registros por estado o región geográfica para Canadá y los Estados Unidos. Para México, los países de Centroamérica y las Indias Occidentales solo se indica la existencia de la especie. La clasificación usualmente sigue las últimas revisiones del grupo. Las tribus están arregladas filogenéticamente

y los generos y especies alfabeticamente. Cada cita incluye el autor original del taxon, el año y numero de pagina de la referencia, su distribucion y sus sinonimias. La distribucion registrada para cada especie refleja unicamente el conocimiento actual de los autores.

ABSTRACT

The Cerambycidae (longhorned beetles; round-headed borers; longicorns) comprise a family of Coleoptera attaining their greatest abundance and diversity in the tropical regions of the World. The larvae display a variety of habits. Some feed in living trees and shrubs, most in dead or dying wood, and some in very decayed wood. Almost all parts of the host plants are utilized as food by larvae; roots, trunks, branches, seeds, bulbs. Some species burrow in soil and feed externally on small roots. A true leaf mining habit is not yet known but some species feed within the fleshy, vegetative portions of cacti.

Adults vary in their habits and different collecting techniques must be employed to obtain specimens. Many are attracted to lights, some to flowers, and some occur on foliage. Freshly cut logs and branches are an excellent source of specimens. Beating is a good method of obtaining smaller species. In some areas, various baits can be utilized to capture adults. Aerial traps generally yield very few cerambycids and light traps are not very efficient. Most Cerambycidae that are attracted to lights do not fly onto the light source preferring to land and sit near the periphery of the illuminated area.

The present list includes about 3300 described species from continental North America, Central America and the West Indies. The classification usually follows the last revisor of the group but we have ignored some efforts by a few authors for the sake of stability and convenience. The tribes are arranged more or less phylogenetically, with the genera and species listed alphabetically for ease of usage. Listed distributions reflect the present knowledge of the authors and without doubt, many can be expanded. Each citation lists the original author of the taxon followed by the year and page number of the reference.

This checklist is a direct offshoot of the project on the Cerambycidae of North America. Because of the volume of new material and publications dealing with the Cerambycidae of this area, it became necessary to update existing lists.

Because of the voluminous bibliography for the checklist, only major works concerning the group will be included.

INTRODUCCION

Los cerambicidos constituyen una de las familias mas grandes del orden Coleoptera y uno de los grupos mas grandes de insectos barrenadores de madera. Hasta la fecha se han descrito alrededor de 20 mil especies, presentando su mayor diversidad en las regiones tropicales del mundo.

Sus especies son exclusivamente fitofagas en estado larval, encontrandose dentro de el toda una variedad de habitos alimenticios. La mayoria se alimenta de madera muerta o agonizante, algunos en arboles o arbustos vivos y otros pocos en madera podrida. Practicamente todas las estructuras de una planta son utilizadas como alimento por sus larvas, encontrandose especies que consumen raices, troncos, ramas, semillas, frutos o tallos herbaceos de plantas anuales. No se conocen especies que sean minadoras de hojas, aunque existen algunas que se alimentan dentro de porciones vegetativas frescas de algunas cactaceas.

La mayoria de las especies que utilizan troncos o ramas como hospederos, se alimentan bajo la corteza y penetran dentro de la misma o dentro de la madera solo para pupar. Sin embargo, existen tambien algunas especies que barrenan poco tiempo bajo la corteza y desarrollan la mayor parte de su vida dentro de la madera.

El tipo de residuos que producen las larvas al barrenar es caracteristico dentro de ciertos grupos, encontrandose algunos que producen residuos muy finos, otros astillas escamosas y otros largas fibras parecidas a pequenas virutas. Tambien es caracteristico en algunos grupos, empaquetar los residuos del barrenado hacia atras del tunel que van abriendo y en otros, expelerlo, manteniendo el tunel siempre abierto.

El proceso de asimilacion de los nutrientes presentes en la madera ha sido poco estudiado, aunque se tiene informacion sobre simbiontes o enzimas que los ayudan en su asimilacion. Se han encontrado organismos similares a levaduras en las celulas de las paredes intestinales de algunas especies, los cuales producen una celulasa que les ayuda a desdoblar la celulosa de su planta hospedera. Por otra parte, se han detectado en algunas especies, enzimas como la celulasa, hemicelulasa, xylenasa, amilasa, invertasa, maltasa y lipasa, mismas que intervienen en el proceso de desdoblar los constituyentes de la madera.

La duracion del ciclo biologico es muy variable entre las especies. El

periodo de incubacion dura entre dos y cinco semanas, requiriendose en la mayoria de los casos 14 dias. El desarrollo larval usualmente dura de uno a tres años, aunque puede ser tan corto como de dos a tres meses o extenderse hasta 20 o 30 años. Este periodo es influido por la temperatura, la humedad y el tipo y edad de la madera. La duracion del periodo pupal en la mayoria de las especies es de una semana a diez dias, sin embargo, en algunas especies puede durar un mes o mas y estar sujeto a modificaciones por condiciones de humedad. Despues de la transformacion, los adultos generalmente permanecen en estado de quiescencia (en la celula pupal) por un periodo de tiempo variable antes de emerger. La fenologia de emergencia de los adultos de las diferentes especies, se presenta en forma secuencial a lo largo del año y depende en gran parte de las especies involucradas y de las condiciones geograficas y climaticas en las que se encuentren.

La emergencia de los adultos de ambos sexos puede ser sincronica o asincronica y dar como resultado diferencias en la seleccion de los sitios de apareamiento entre los sexos. En especies sincronicas el apareamiento tiene lugar en el sitio de emergencia y en especies asincronicas usualmente en su planta hospedera (a excepcion de las especies visitantes de flores). En la mayoria de los casos los machos emergen antes que las hembras, es decir, son asincronicos. La localizacion del otro sexo (o de la planta hospedera) es lograda gracias a organos olfatorios que se localizan en las antenas y es ayudado en algunos grupos, por la secrecion de olores muy penetrantes que tienen una funcion de atrayente sexual.

La oviposicion generalmente se realiza en hendiduras o grietas de la corteza o alrededor de areas danadas de la planta hospedera, sin embargo, en algunos casos implica solamente la inclusion de los huevos en madera podrida y en otros, la utilizacion de las mandibulas para preparar los sitios de oviposicion. El numero de huevos producidos varia de unos pocos hasta algunos cientos.

La especificidad hacia sus plantas hospederas es variable dentro del grupo, encontrandose desde especies muy especificas hasta especies altamente polifagas.

En la mayoria de las especies, los adultos se alimentan en plantas diferentes a las de sus larvas. Estos, al igual que las larvas, presentan una amplia gama de habitos alimenticios (aunque tambien existen especies que practicamente no se alimentan) y al parecer, en algunos casos su alimentacion es un prerrequisito para la maduracion de los huevos y posterior oviposicion. Existen especies que se alimentan de flores, corteza, hojas, agujas y conos de pinos, savia, frutos, raices y hongos. Las especies que se alimentan de flores usualmente son generalistas y son considerados como el grupo de coleopteros mas importantes desde el punto de vista de la polinizacion. La actividad como adultos parece ser muy corta, oscilando entre una semana y un mes, restringiendose practicamente al periodo de apareamiento y oviposicion.

Dado la variedad de habitos de los adultos, las tecnicas empleadas para su colecta son variables. Las especies encontradas en flores son colectadas con redes y las encontradas en troncos y ramas recién cortados (excelentes fuentes de especimenes) o en el follaje, a traves del metodo de golpeo ("beating sheet"). Las especies fototropicas son atraidas a fuentes luminosas, aunque es conveniente mencionar que las trampas de luz son poco eficientes, debido a que los cerambicidos atraidos no vuelan hasta la fuente de luz, sino que se posan antes y permanecen en los alrededores. En lugares abiertos pueden utilizarse otro tipo de trampas, tales como trampas aereas y trampas "Malaise", aunque en general, estas producen pocos especimenes.

Los individuos de este grupo habitan principalmente en bosques y selvas y su papel ecologico dentro de los mismos es degradar la madera muerta. Su lugar en la sucesion de insectos que intervienen en la degradacion de la madera varia entre las especies (dependiendo de su historia de vida y habitos), los hospederos y de region a region, aunque de forma general, este grupo esta considerado como fundamental en el inicio del proceso de degradacion. Ahora

bien, bajo condiciones de perturbacion, algunas especies pueden provocar serios danos a especies de valor economico para el hombre, convirtiendose entonces en un problema bastante serio para el mismo. Esto generalmente se presenta en bosques de coniferas, en donde arboles danados pueden ser seriamente infestados y su madera sufrir un fuerte deterioro en su clase y valor economico. Por otra parte, existen especies que infestan de manera constante madera extraida con fines comerciales, deteriorando tambien su valor comercial o provocando danos posteriores a su uso. En lo que respecta a especies danando arboles vivos, existen algunas que atacan arboles ornamentales y otras que son consideradas pestes en la horticultura. Dentro de los primeros, se encuentran especies que atacan acacias, arces, nogales, alamos, olmos, framboyanes, etc. y dentro de los segundos, especies que utilizan manzanos, perales, membrillos, citricos, tamarindo, cafe y cacao. Se han registrado tambien algunas especies provocando danos en cultivos de algod6n, maiz, girasol, soya y ajonjolí.

Los predadores mas importantes de este grupo se encuentran entre las familias Cucujidae, Ostomidae, Cleridae, Colydiidae y Elateridae, todas ellas del orden Coleoptera. Otros grupos de insectos con predadores importantes se encuentran en los ordenes Diptera y Hemiptera. Dentro de los vertebrados, en aves, reptiles y mamiferos se encuentran tambien grupos que los depredan, pudiendose mencionar, pajaros carpinteros, lagartijas, sapos, musaranas y ratones. Respecto a sus parasitoides, la gran mayoria pertenecen al orden Hymenoptera, destacando de entre ellos los individuos de Braconidae e Ichneumonidae y en menor importancia Bethylidae, Eulophidae, Encyrtidae, Eupelmidae, Pteromalidae y Eurytomidae.

Su importancia biologica, ecologica y economica, asi como las formas tan llamativas de algunas de sus especies, les ha valido la atencion de numerosos investigadores y colectores, lo que ha generado un incremento notable en el conocimiento sobre este grupo. No obstante, los trabajos que compilan el conocimiento de la fauna de Norteamerica, Centroamerica y las Indias Occidentales son poco numerosos (Bates, 1879-1885; Blackwelder, 1946; Chemsak & Linsley, 1975), siendo publicado el ultimo en 1975. Desde entonces, se ha generado numerosa informacion acerca del grupo, haciendose necesaria su publicacion para actualizar las listas existentes. Ahora bien, la presente contribucion es el resultado directo de un proyecto sobre los Cerambycidae de Norteamerica y se sustenta en la informacion que se ha publicado sobre el mismo.

AGRADECIMIENTOS

Numerosas personas han contribuido en la compilacion de este listado, ya sea en forma de adiciones o de correcciones. En especial, se agradece a E. F. Giesbert y F. T. Hovore por su colaboracion en el mantenimiento del listado actualizado.

ESTRUCTURA DEL LISTADO

La clasificacion utilizada en el listado sigue las ultimas revisiones del grupo, sin embargo, se han ignorado los trabajos de algunos autores por razones de estabilidad y conveniencia. Las tribus estan arregladas filogeneticamente (en la medida de lo posible) y los generos y especies alfabeticamente para su mejor accesibilidad. Cada cita incluye el autor original del taxon, el año y numero de pagina de la referencia, sus sinonimias y la distribucion conocida para cada especie, que refleja solo el conocimiento actual de los autores y que sin duda podra incrementarse en un futuro.

Dentro del listado, los nombres genericos y especificos validos se presentan en negritas. Las sinonimias estan colocadas abajo del nombre valido, con una sangria. Las subespecies se ubican al nivel de las sinonimias especificas, estan senaladas con un indice alfabético en letras minusculas, se presentan en negritas e incluyen su distribucion conocida. La presencia de un

guion entre países, regiones o estados, indica que la distribución de la especie se extiende desde un punto al otro.

Con el fin de reducir el espacio, se utilizan abreviaturas a lo largo del texto. Estas se citan a continuación, junto con su significado.

Alas - Alaska (EU)	Is - Isla

En el listado se utiliza el nombre de Isla La Española como sinónimo de Haití y la República Dominicana y el de Indias Occidentales como sinónimo de las Antillas Mayores y Menores. Las Islas Revillagigedo y las Islas Tres Marias pertenecen a México.

Dado el volumen que implicaría incluir todas las citas bibliográficas, se decidió incluir solo las citas de los trabajos taxonómicos más importantes del grupo.

fuscula Bates 85-273	Mexico
geniculata Bates 72-195	Guatemala-Panama
hoegei Bates 85-271	Mexico
irregularis Linsley 35-70	Mexico
languroides Bates 85-275	Mexico
limbata Bates 85-273	Mexico
lineatopora Bates 80-35	Guatemala
nigrella Bates 80-36	Guatemala
phaeocera Bates 80-35	Nicaragua
rufipes Bates 72-196	
pictipes Bates 85-272	Guatemala
pilatei Chevrolat 57-104	Mexico-Panama
punctiventris Bates 85-274	Panama
rugiscapus Bates 85-272	Panama
sallaei Bates 85-273	Mexico
simplex Bates 85-274	Panama
spinipennis Fisher 46-330	Costa Rica
spinosa Bates 85-273	Panama
striatiscapis Villiers 59-74	Costa Rica
trifasciata Bates 92-157	Mexico
undata Fabricius 75-181	eEU
undulata Gmelin 90-1860	
vittata Bates 80-36	Guatemala
Paracometes Villiers 57-412	
emarginata Fisher 46-331	Costa Rica
eximius Bates 85-275	Panama
festivus Bates 85-275	Panama
fertiva Boppe 21-9	
hilaris Bates 85-276	Panama
pulcherrimus Bates 72-196	Nicaragua
venustus Bates 85-276	Panama

INDICE DE SUBFAMILIAS, TRIBUS, GENEROS Y SUBGENEROS
(Los sinonimos estan con sangria)

Acanthocini	Alcyopsis Pascoe
Acanthoderes Serville	Aletretia Bates
Acanthoderes Haldeman	Allaeoscelis Bates
Acanthoderini	Allorhagium Kolbe
Acanthopterus Guerin	Alosternida Podany
Acanthosphenopsilus Tippmann	Alphinellus Bates
Acarinozineus Gilmour	Alphomorphus Linsley
Acestrilla Bates	Alphus Thomson
Achryson Bates	Amannus LeConte
Achrysonini	Amaurostoma Muller
Acmaeops LeConte	Amblysaphes Bates
Acmaeopsilla Casey	Amilia Mulsant
Acmaeopsoides Linsley & Chemsak	Amillarus Thomson
Acrepidopterum Fisher	Amniscus Haldeman
Acrocinini	Amphelictus Bates
Acrocinus Illiger	Amphicnaeia Bates
Acyphoderes Serville	Amphilestes Blackwelder
Adesmus Latreille	Amphilestes Gilmour
Adetus LeConte	Amphionthe Bates
Aegilopsis Horn	Amphionycha Leconte
Aegoidus Buquet	Amphionycha Leseleuc
Aegomorphus Haldeman	Anacanthini
Aegomorphus Thomson	Anacanthus Serville
Aegoschema Aurivillius	Anacolini

Aegoschema Knull
 Aerenea Thomson
 Aerenicini
 Aerenicopsis Bates
 Aesylacris Thomson
 Aethecerinus Fall & Cockerell
 Aethecerus Chevrolat
 Aethiopoctines Thomson
 Aethomerus Thomson
 Agallissini
 Agallissus Dalman
 Agapanthiini
 Agennopsis Thomson
 Alampyris Bates
 Alastos Napp & Martins
 Alcathous Thomson
 Alcidion Sturm

 Anocomis Casey
